

Multi-omics Data Integration

Amrit Singh, PhD

Assistant Professor

June 7th, 2023 | 13:00-15:00 PST

TOG Intermediate Workshop
BCCHR Trainee Omics Group (TOG)

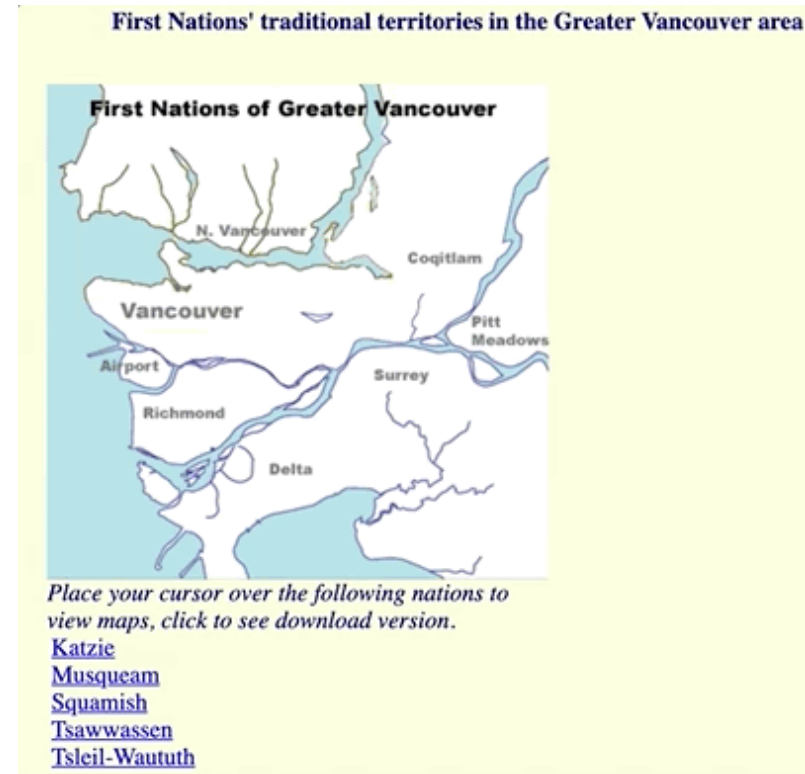

Land acknowledgement

I would like to acknowledge that I work on the traditional, ancestral, and unceded territory of the Coast Salish Peoples, including the territories of the xwməθkwə́yəm (Musqueam), Skwxwú7mesh (Squamish), Stó:lō and Səlílwətaʔ/Selilwitulh (Tsleil- Waututh) Nations.

Traditional: Traditionally used and/or occupied by Musqueam people

Ancestral: Recognizes land that is handed down from generation to generation

Unceded: Refers to land that was not turned over to the Crown (government) by a treaty or other agreement

What are your expectations from today's workshop?

What are you expectations from today's workshop?

4 

beginner
learn new R packages for omics analysis
Just exploring

Learning outcomes

By the end of this lecture you will be able to:

1. Describe what the *mixOmics* R-library can do.
2. Describe when to use which method and for what purpose (exploration, classification, integration).
3. Analyze data using mixOmics for various purposes (exploration, classification, integration)

High-dimensional data

- $n \ll p$ (number of observations is much smaller than the number variables)
- data is highly correlated

univariate

```
##      p_1
## 1 -0.646
## 2  0.544
## 3 -0.325
## 4 -0.136
## 5 -0.630
## 6 -0.682
## 7  0.768
## 8 -0.662
## 9  0.304
## 10 0.907
```

multivariate

SAMPLE PLOTS

VARIABLE PLOTS

Getting started with mixOmics

1. Download R
2. Download RStudio
3. install mixOmics

install mixOmics

```
if (!require("BiocManager", quietly = TRUE))  
  install.packages("BiocManager")  
  
BiocManager::install("mixOmics")
```

load vignette

```
browseVignettes("mixOmics")
```

Dataset used in this talk

Breast Cancer multi omics data from TCGA

This data set is a small subset of the full data set from The Cancer Genome Atlas that can be analysed with the DIABLO framework. It contains the expression or abundance of three matching omics data sets: mRNA, miRNA and proteomics for 150 breast cancer samples (Basal, Her2, Luminal A) in the training set, and 70 samples in the test set. The test set is missing the proteomics data set.

```
library(mixOmics)
data(breast.TCGA)
lapply(breast.TCGA$data.train, dim)
```

```
## $mirna
## [1] 150 184
##
## $mrna
## [1] 150 200
##
## $protein
## [1] 150 142
##
## $subtype
## NULL
```

breast cancer subtypes

```
addmargins(table(breast.TCGA$data.train$subtype))
```

```
##
## Basal Her2 LumA Sum
##    45    30    75 150
```

Types of analyses covered:

Analysis	Methods	Functions	Input	Output
Exploratory data analysis	PCA	pca() plotIndiv()	X	
Discriminant analysis	sPLSDA	splsda() tune(), perf() plotIndiv(), plotVar()	X	Y
Data integration analysis	DIABLO	block.splsda() tune(), perf() plotDiablo(), circosPlot()	X_1, \dots, X_J	Y

Exploratory data analysis using PCA

```
J <- length(breast.TCGA$data.train)-1
pcs <- lapply(breast.TCGA$data.train[1:J], mixOmics::pca)

mapply(function(pca, dataset){
  mixOmics::plotIndiv(pca,
    title=dataset,
    group=breast.TCGA$data.train$subtype,
    style="graphics",
    legend=TRUE,
    ellipse = TRUE,
    ellipse.level = 0.90)
}, pca=pcs, dataset=names(breast.TCGA$data.train)[1:J])
```

Discriminant analysis using sPLSDA

- based on the eda it seems **mrna** is better at separating classes than **mirna**, lets test this.
- this may or may not be true since we peeked at the data (need to test model with another dataset)

- mrna

```
mrna_model <- mixOmics::splsda(X = breast.TCGA$data.train$X
                              Y = breast.TCGA$data.train$Y
                              keepX = c(5, 5),
                              ncomp = 2)
mrna_perf <- mixOmics::perf(mrna_model, validation = "cv")
mrna_perf$error.rate
```

```
## $overall
##           max.dist centroids.dist mahalanobis.dist
## comp1 0.22133333      0.1760000      0.1760000

How to select *ncomp* and *keepX*? use a grid of values

- mrna

```
tune_mrna = mixOmics::tune(method = "splsda", X = brea  
                           Y=breast.TCGA$data.train$subtype, nco  
                           test.keepX = c(5, 10, 15, 30, 100, 20  
                           progressBar = FALSE)  
plot(tune_mrna)
```

- mirna

```
tune_mirna = mixOmics::tune(method = "splsda", X = bre  
                           Y=breast.TCGA$data.train$subtype, nco  
                           test.keepX = c(5, 10, 15, 30, 100, 20  
                           progressBar = FALSE)  
plot(tune_mirna)
```

Test sPLSDA models using data from other observations (patients)

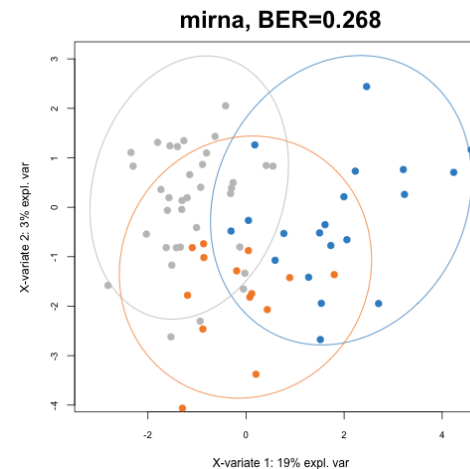

- mrna

```
mrna_model <- splsda(X = breast.TCGA$data.train$mrna,  
                    Y = breast.TCGA$data.train$subty,  
                    keepX = rep(5, 3),  
                    ncomp = 3)  
mrna_pred <- predict(mrna_model, newdata = breast.TCGA  
plotIndiv(mrna_model, comp = 1:2, rep.space = "X-vari  
points(mrna_pred$variates[, 1], mrna_pred$variates[, 2
```

- mirna

```
mirna_model <- splsda(X = breast.TCGA$data.train$mirna  
                    Y = breast.TCGA$data.train$subty  
                    keepX = rep(5, 3),  
                    ncomp = 3)  
mirna_pred <- predict(mirna_model, newdata = breast.TC  
plotIndiv(mirna_model, comp = 1:2, rep.space = "X-vari  
points(mirna_pred$variates[, 1], mirna_pred$variates[,
```

Model interpretation

- determine variables with most importance in mrna model

```
rbind(selectVar(mrna_model, comp=1)$value,  
      selectVar(mrna_model, comp=2)$value,  
      selectVar(mrna_model, comp=3)$value)
```
